

Abstract

Method for manufacturing a set of strings for use with a musical instrument in which a plurality of sizes of the strings in the set are determined and a plurality of colors for the strings in the set is selected, a unique color for each string. For each string, a core wire and a wrap wire, each having a diameter size specific to the size of that string, are provided and only the wrap wire is coated with an enamel having the color of that string. The coated wrap wire is wound around the core wire and the thus-joined wrap wire and core wire are baked to form the string. As a result, each string has its unique color and specific size and when arranged on the instrument, a musician can associate colored notes on a sheet of music with each string and thereby learn how to play the instrument.
